Mogi, item hunt
A new collection game

A game where players move outside, pick-up virtual items through their mobile phone interface then trade with other players to complete collections. The goal is to get the maximum points completing collections.

It is based on players' location. From the Web interface, players see in real time, on a 3D map, the positions of connected players as well as collection items. From both interfaces, players trade the items picked-up with the mobile.

Mogi is a community game, featuring a complete IM system. A web player might help a mobile player by clicking on its character on the map and sending "Lucky you! North, close to you, lies a rare item. Get it, get it ! :)" which will pop on the screen of the mobile player.

Let's play !

An Ezplus game

Supported types: GPS, J2ME AU Phones (KDDI, JAPAN)
Supported terminals : A5401, A5402, A5305, A5303, A5302, A5301, A3015, A3014,

GCALSYNC

SYNCHRONIZE YOUR PHONE WITH GOOGLE CALENDAR

Carry your Google Calendar in your pocket! GCalSync is an [open source](#) application that lets you do a two-way synchronization between [Google Calendar](#) and your phone's built-in calendar. Download events to your phone, or add an event on your phone and upload it to Google Calendar.

To install, visit <http://wap.gcalsync.com> with your phone's browser

You can also download the files here if you prefer to install via USB, Bluetooth or infrared (see your phone's manual for how to do this).

[gcalsync.jar gcalsync.jar](#) signed version - for most phones

[gcalsync.jar gcalsync.jar](#) unsigned version - try this if your phone will not let you install the signed version

[gcalsync.jar gcalsync.cod](#) for Blackberry

NEW: Version 1.1.1 released, a bug fix to the first version after I open sourced GCalSync. Source code is available on [SourceForge](#). New in version 1.1:

- Time zone options: you can specify an offset if you have problems with events being a couple of hours off.
- Download/upload options: choose if you want to just download events from GCal, just upload events from the phone, or both.

Known problems:

- Changes and deletions on the phone are not uploaded. I am getting error messages from GCal when I do this so it is disabled for now.

<http://www.gcalsync.com>

On some phones (Nokia Series 60) events get duplicated in GCal every time you sync. Use the new

Download **mobup** for FREE

Download source code

Mobup source code is now available for free under GNU General Public License and is hosted on Sourceforge, the world's largest Open Source software development web site. (Visit developer section for more infos)

Latest Mobupped shots

Flickr from your mobile device built using the Flickr APIs. Once installed it gives you the possibility to shoot your photo and add title, tags and description, manage sets and groups from the same applications with optimal user experience and to post the shoted photo on your blog.

Mobup is being developed as by the CT|DND team and a bunch of other programmers; Mobup is actually in public beta: thanks to the group of volunteers that daily apply for testing (if you want to be included just send us an email specifying your Java phone model).

Installing Mobup

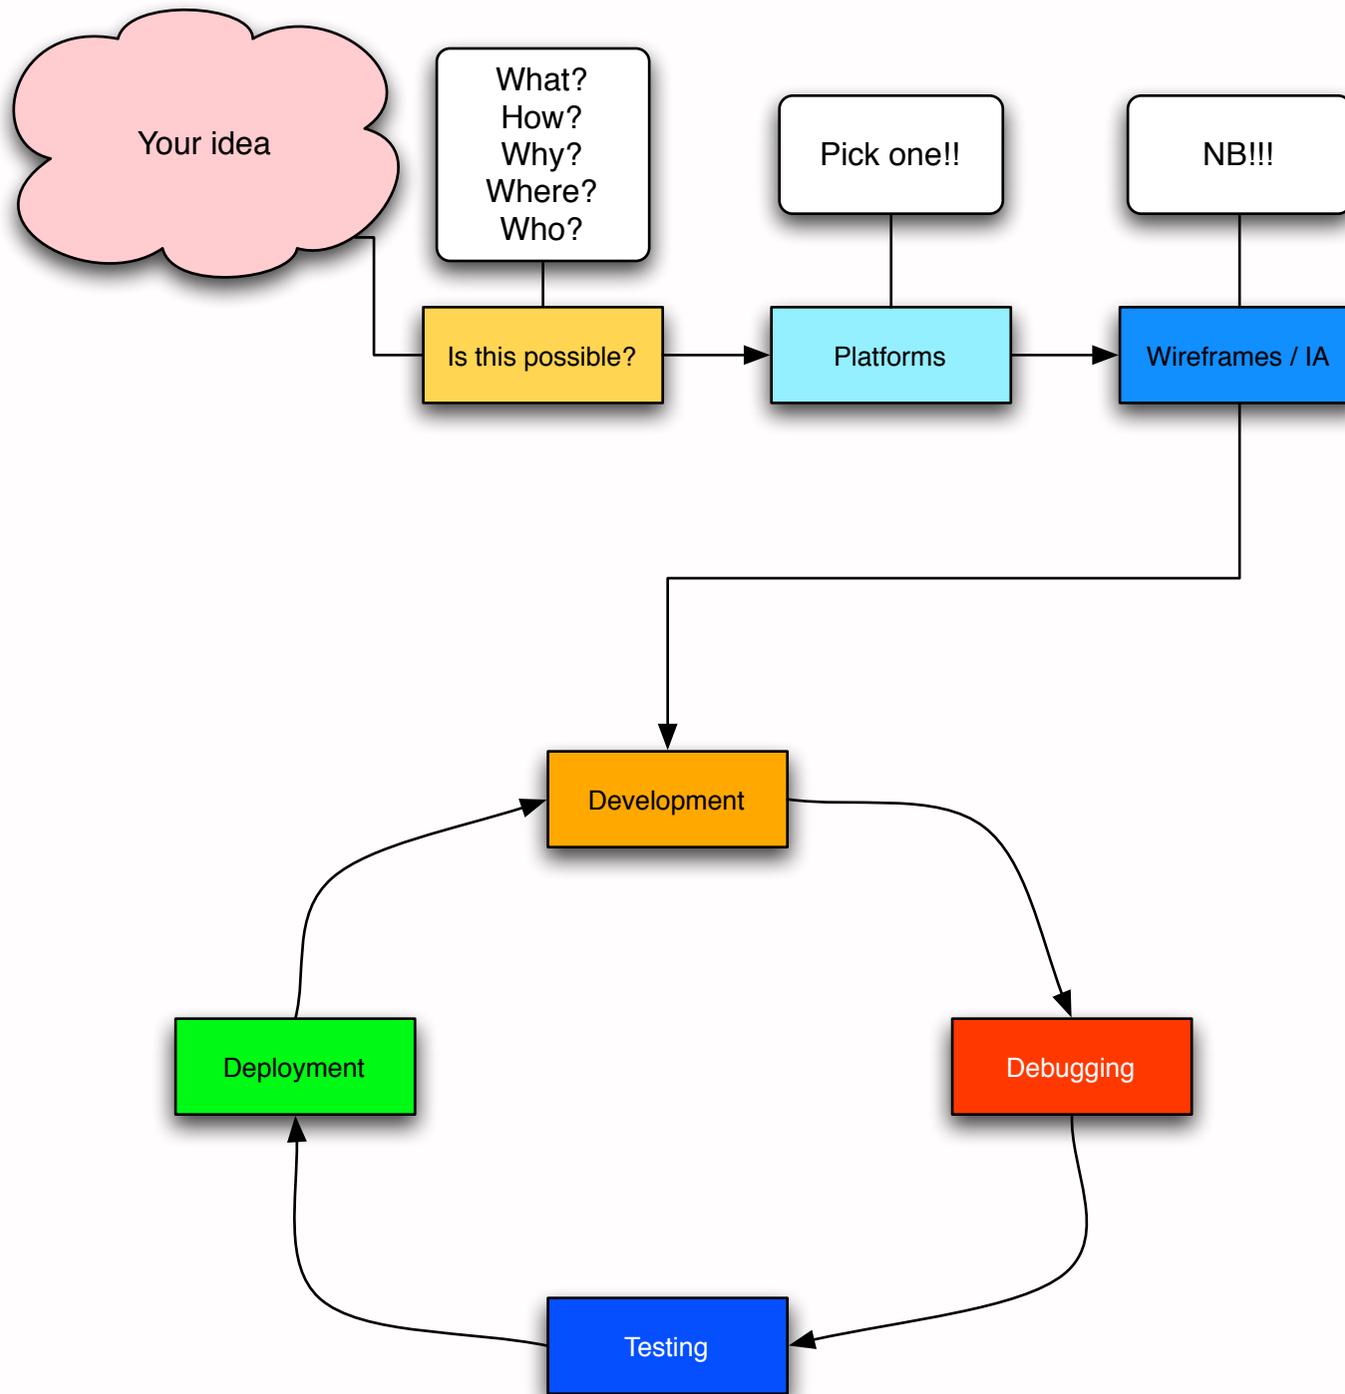

Mobup activation on Flickr

1. Go to the [activation page](#)
 1. If necessary log in
 2. Click *OK, I'LL ALLOW IT*
 3. Write down the 9 numbers code xxx-xxx-xxx (Token) .
2. End of this procedure

```
MIDlet-1: FormMIDlet,,FormMIDlet
MIDlet-2: ItemMIDlet,,ItemMIDlet
MIDlet-3: TextBoxMIDlet,,TextBoxMIDlet
MIDlet-4: TextBox2MIDlet,,TextBox2MIDlet
MIDlet-Jar-URL: Forms-A-Go-Go.jar
MIDlet-Name: Forms-A-Go-Go Suite
MIDlet-Vendor: Uberthings, Inc.
MIDlet-Version: 1.0.7
MicroEdition-Configuration: CLDC-1.0
MicroEdition-Profile: MIDP-2.0
```

Compilation

Tips

- Use **System.out.println** to print out to console
- What works in the emulator **MAY NOT** work identically on phone
- Emulator runs code **much** faster than device

Deployment!!!!

Package your MIDlets

JADs and JARS

- Java Application Descriptor (JAD)
- Java Archives (JARs)

JAD

- describes MIDlet suite
- specifies name, icon, MIDlets, permissions

JAR

- contains class files, resources

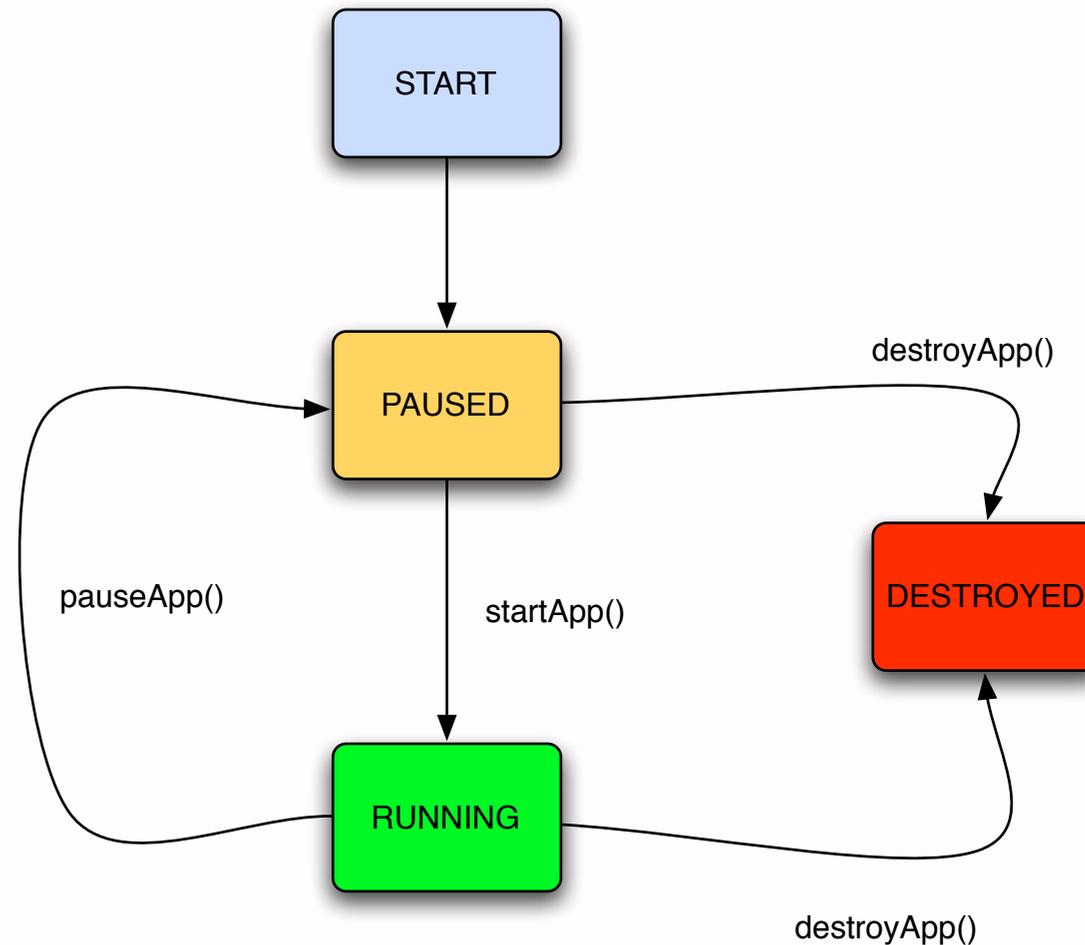

AMS

- application management software

Deploy

- OTA
 - .htaccess
 - MIME-Types
- Bluetooth (OS X, Windows)
- MPowerPlayer Webstart

The Not-So-Secret Lives of MIDlets

OR

A MIDlet's Life

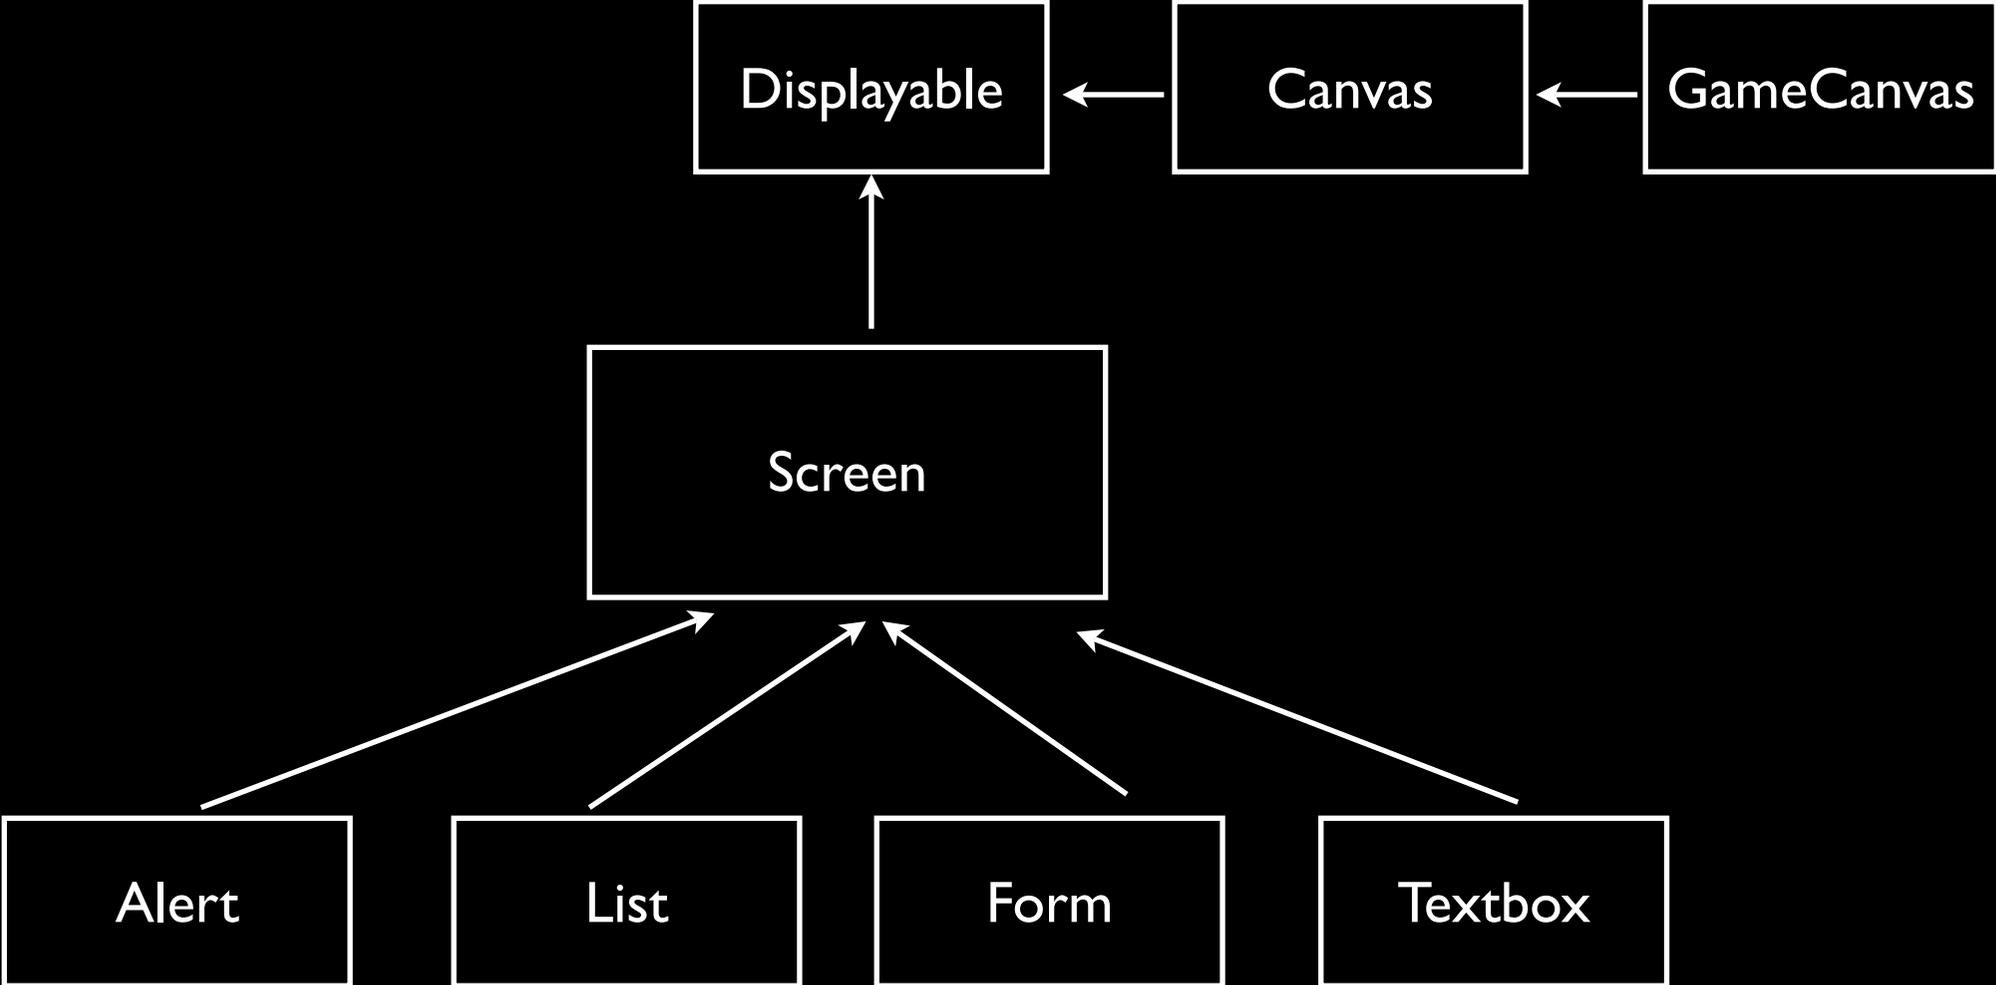

1. Show a Displayable
2. Wait for input
3. Do something, then show next screen
4. Repeat. Or exit.

MIDlet UI

- 2 main options
- Abstraction
 - High level classes, Screens (Alert, List, Form, Textbox)
- Discovery
 - Low level classes - Canvas, GameCanvas
- javax.microedition.lcdui + .game

High Level

Low Level

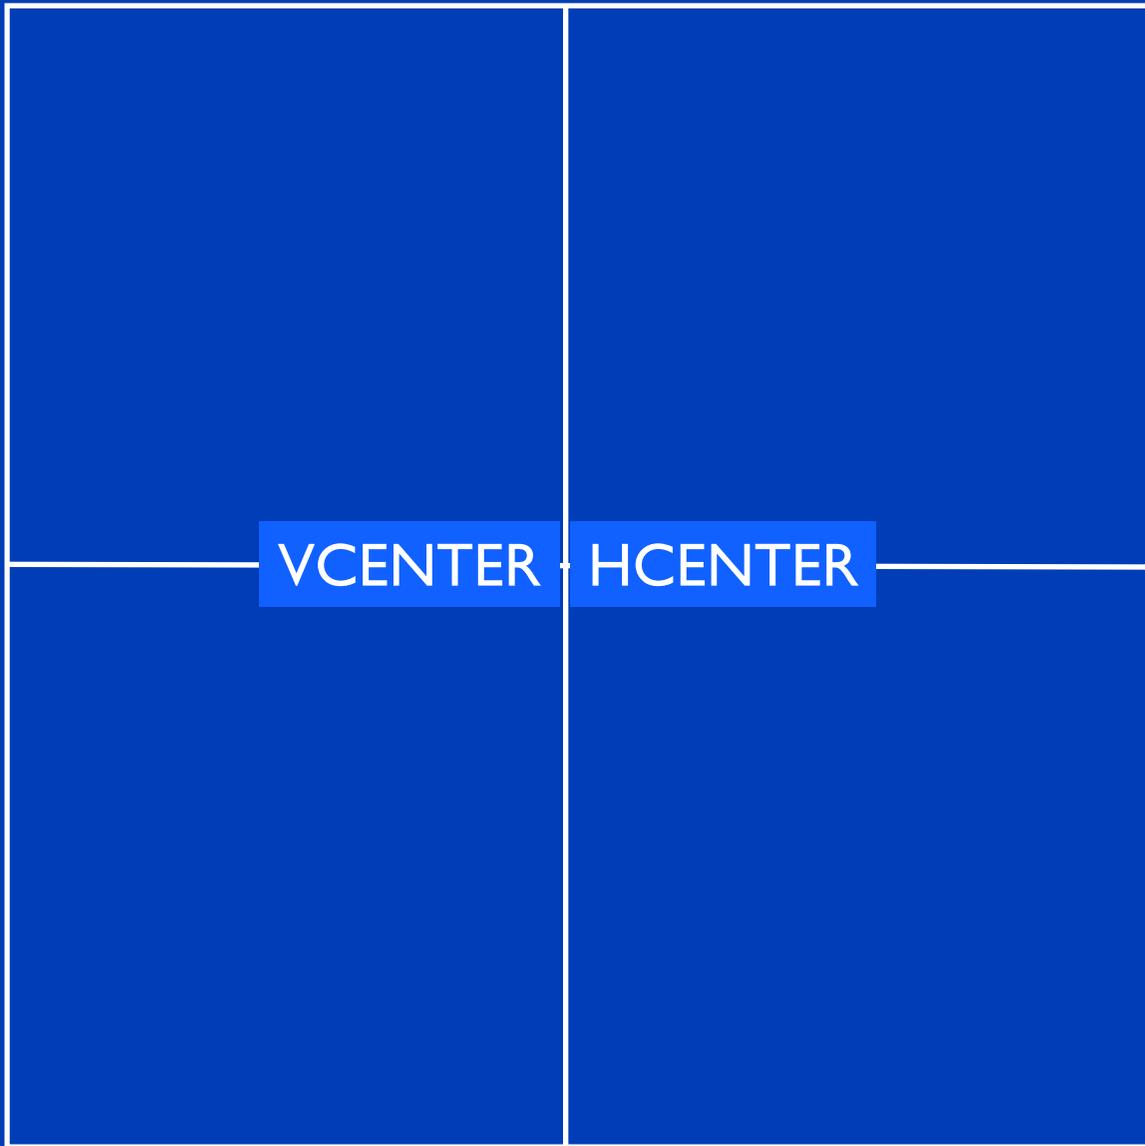

Canvases

- Low-level
- Discovery
- Event handling
- More control over UI
- Animation

Threads

- What are threads?
 - “Single sequential flow of control”
- AKA sub processes which will do things for you
- Application = System thread + other threads
- J2ME is **multithreaded**

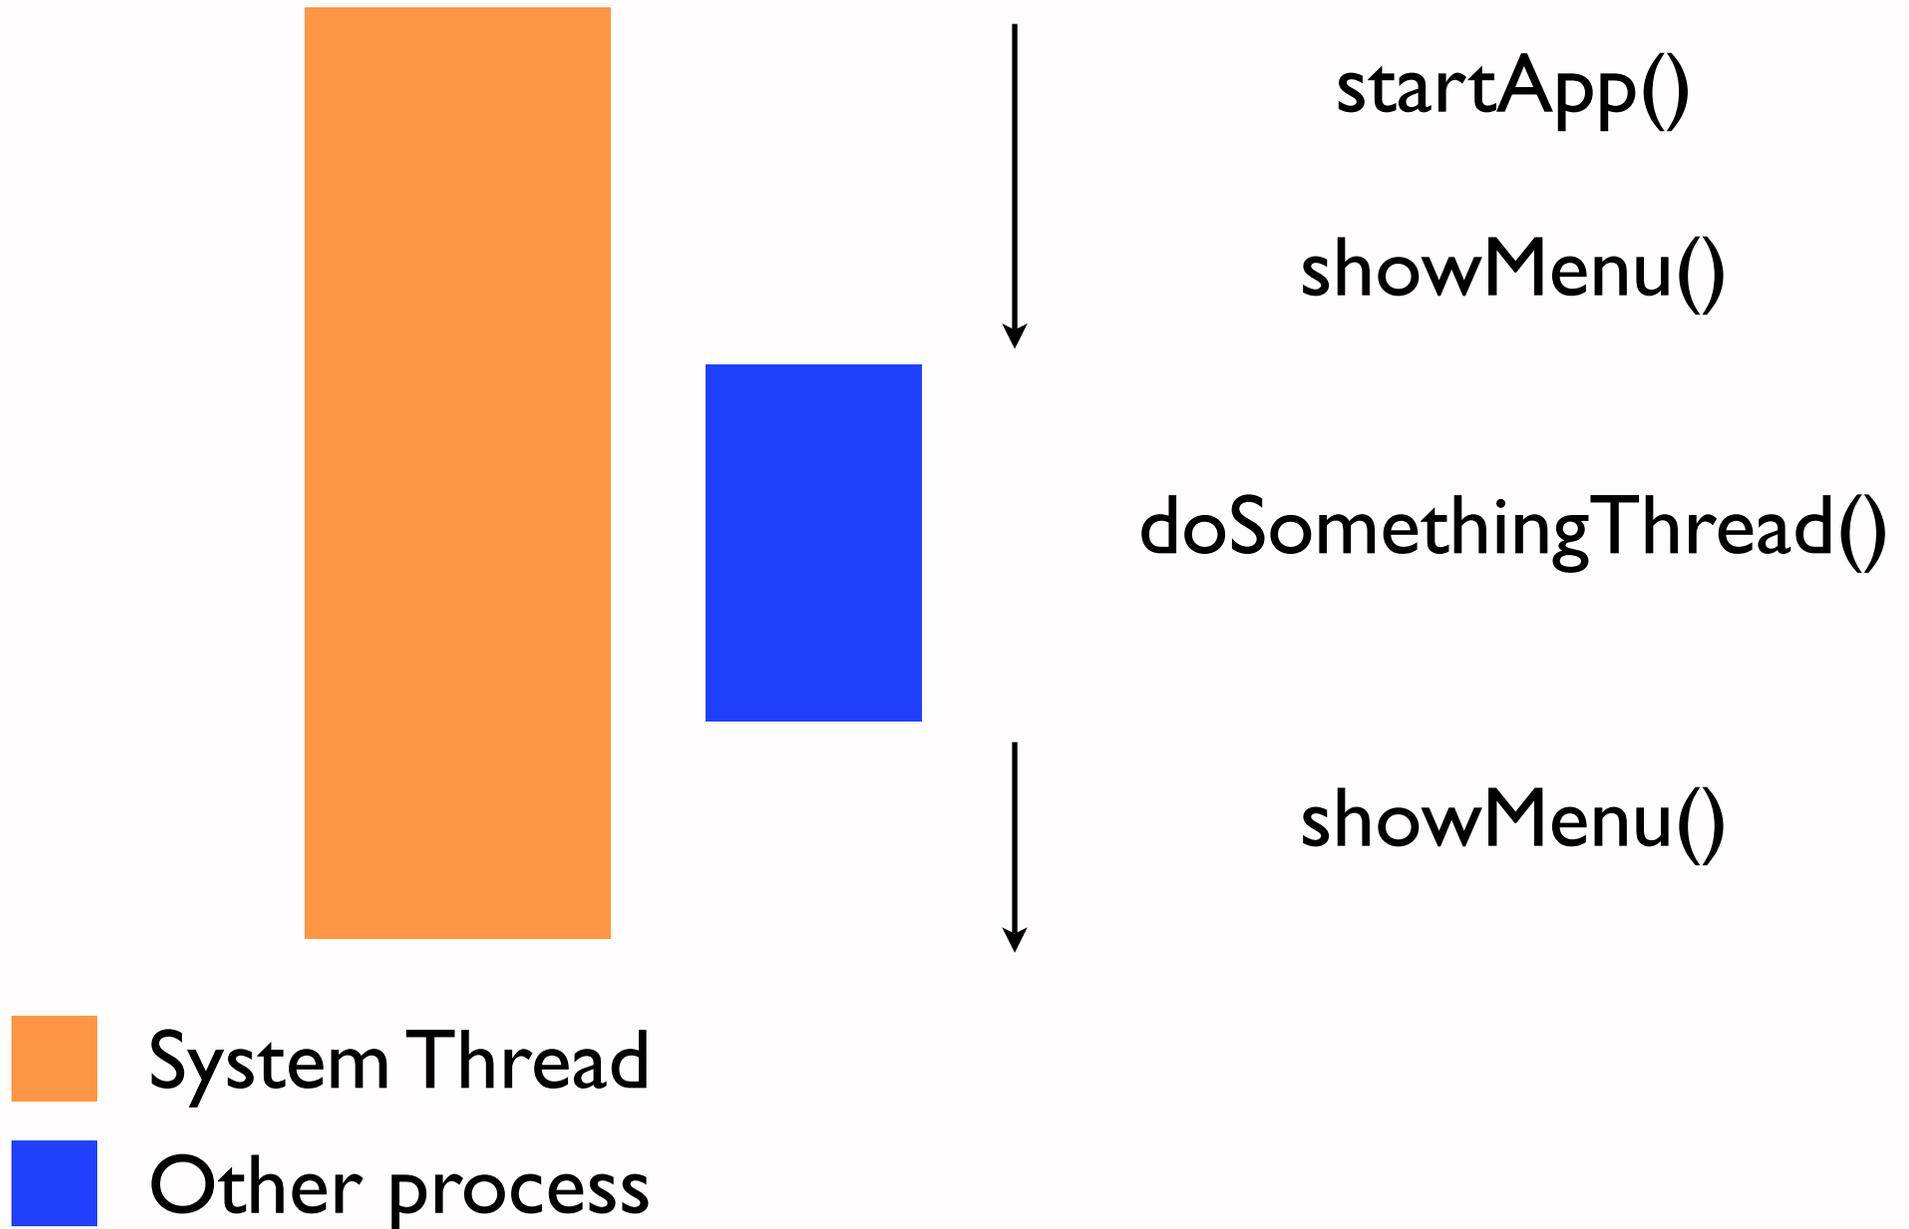

Threads (2)

- Every thread has a context
 - **Running** thread is executing code
 - **Ready** thread is ready to execute code
 - **Suspended** thread is waiting on an external event.
 - **Terminated** thread has finished executing code.
- Threads are scheduled (usually by OS)

Unthreaded MIDlet

Threaded MIDlet

Threads (3)

- To use threads you need:
 1. an instance of `java.lang.Thread`
 2. an object that implements `java.lang.Runnable`

Using Threads

```
public class DoSomething implements Runnable {  
    public void run(){  
        // here is where you do something  
    }  
}
```

```
DoSomething dolt = new DoSomething();  
Thread myThread = new Thread( dolt );  
myThread.start();
```
